No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                            Score

The method comprises administering an immunogenic amount of a possible salmonis specific antigen termed OspA, or an immunogenic fragment of OspA in the form of a vaccine. The method is used for protecting animals, particularly poikilothermic fish, against the bacterial pathogen particularly poikilothermic fish, against the bacterial pathogen particularly poikilothermic fish, against the bacterial pathogen prickettsial septicaemia (SRS) and other rickettsial diseases. The present sequence represents P. salmonis OspA DNA termed C17E2 optimised for expression in Escherichia coli fused to DNA encoding an undefined N-terminal fusion partner. The protein encoded by this fusion construct is used in a vaccine to create an anti-OspA antibody response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (KAYW/)

This invention relates to a method for the protection against infection of a poikliothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a P. salmonis specific antigen termed OspA, or an immunogenic fragment of OspA in the form of a vaccine. The method is used for protecting animals
                                                                                        Method for protecting poikilothermic fish against salmonid rickettsial septicaemia and other rickettsial diseases comprises administering a vaccine containing the OspA protein of Piscirickettsia salmonis -

The present invention relates to methods and compositions for cross-
linking and/or modifying the properties of polysaccharide materials.

The method involves treating the polysaccharide structure with a polysaccharide binding domain (PBD) fusion protein. The method is used to alter the structural, chemical, physical, electrical and mechanical properties of polysaccharide materials such as paper, fibers and textiles, using biological crosslinking agents.

The polysaccharide containing materials have improved mechanical properties such as wet strengths, durability and elasticity. The PBD reagent is applied in the forming stage in fluting paper manufacture which eliminates the sizing step. The use of a biological crosslinker improves the recyclability of paper products. The PBD reagent maintains the fibers in a slurry therefore resulting in better recovery of raw materials. The PBD molecules are eluted by strong alkaline conditions which enhances the ability of the alkaline glue used in binding to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is a DNA encoding Clostridium cellulovorans cellulose binding domain (CBD)-180. CBD-180 contains 180 amino acids Clostridium cellulovorans CBD (CBDclos) of cellulose binding protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Example 1.2; Fig 1e-1g; 121pp; English

                                                                                                                    polysaccharide binding domain (PBD) fusion protein. The method is used to alter the structural chemical, physical, electrical and mechanical properties of polysaccharide materials such as paper, it bers and textiles, using biological crosslinking agents. The polysaccharide containing materials have improved mechanical properties such as wet strengths, durability and elasticity. The PBD reagent is applied in the forming stage in fluting paper manufacture which eliminates the sizing step. The use of a biological crosslinker the fine fibers in a slurry therefore resulting in better recovery of raw materials. The PBD molecules are eluted by strong alkaline conditions which enhances the ability of the alkaline glue used in binding to
                                                                  Sequence
                                                                                          cellulose binding
                                                                                                                                                                                                                                                                        The present invention relates to methods and compositions for cross-linking and/or modifying the properties of polysaccharide materials. The method involves treating the polysaccharide structure with a polysaccharide binding domain (PBD) fusion protein. The method is

comprising the CBD and a second protein. The second protein is pref. Protein A, heparinase, a hormone or an enzyme capable of degrading an environmental pollutant, or an HSP, HSP antibody, cross-reactive HSP-related protein or an antigenic portion of this. The CBD and FP may be used in drug delivery, affinity sepns. and diagnostic techniques. CBD nucleic acid may be obtd. from a variety of cell sources that produce CBDs that bind with high affinity and in a
                                                                                  AAQ72917/R63634 is a novel isolated cellulose binding domain. It is binds crystalline with a Kd ranging from 1.5 microM - 0.5 microM, pref. with a Kd of <1.2 microM, esp. <1.0 microM. The protein and the encoding DNA are claimed, as is a CBD fusion protein (FP)
                                                                                                                                                 Claim 10; Fig 1; 125pp; English.

This sequence encodes a cellulose binding domain (CBD) derived from the CbpA protein of Clostridium cellulovorans. The sequence is used the construction of a fusion protein which can be used in diagnostic immunoassays, e.g. to detect heat-shock proteins (HSP) and their cross-reactive proteins, antigenic fragments or HSP-specific antibodies (which indicate insulin-dependent diabetes mellitus, or susceptibility to it. The CBD, has very high affinity for cellulose (including crystalline forms) and chitin (dissociation constant 0.8-1.4 mu M), but has almost no cellulolytic or amorphogenic activities. The CBD binds over a wide pH range and is not released from cellulose by washing with water.
                                                                                                                                                                                                                                                                                  Clostridium celulovorans.

It was obtained by PCR amplification (see also AAX24952-53), and was used in the construction of binary vector pCCl, in which cbd was joined to the promoter and signal region of the novel endo-1,4-beta-glucanase cell gene (see AAX24923) of Arabidopsis thaliana. Expression of cbc in transgenic tobacco plants modulated their growth. The cell promoter can provide expression of any protein in elongating tissue. CBD is an example of a cell wall modulation transgene used to alter the structure or morphology of a plant. Transgenic plants of the invention may have altered biomass, growth, yield,

                                                                                                                                                                                                                                                                                                    QУ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to methods and compositions for cross-
CC linking and/or modifying the purperties of polysaccharide materials.
CC The method involves treating the polysaccharide structure with a CC polysaccharide binding domain (PBD) fusion protein. The method is CC used to alter the structural, chemical, physical, electrical and CC mechanical properties of polysaccharide materials such as paper, CC yarns, fibers and textiles, using biological crosslinking agents.
CC The polysaccharide containing materials have improved mechanical properties such as wet strengths, durability and elasticity. The PBD CC reagent is applied in the forming stage in fluting paper manufacture which eliminates the sizing step. The use of a biological crosslinker CC improves the recyclability of paper products. The PBD reagent maintains CC in ine fibers in a slurry therefore resulting in better recovery of CC raw materials. The PBD molecules are eluted by strong alkaline conditions which enhances the ability of the alkaline glue used in binding to CC cenetrate paper.
                                                                                                                                                                                                                                                                                                                                         Matches
